**Problem Inner Product Bilinearity.** Let V be a vector space equipped with an inner product  $\langle .,. \rangle : V \times V \to \mathbb{R}$ . Show that the inner product is bilinear.

*Proof.* We'll first show additivity in the second slot. We have

$$\langle u, v + w \rangle = \overline{\langle v + w, u \rangle}$$

$$= \overline{\langle v, u \rangle + \langle w, u \rangle}$$

$$= \overline{\langle v, u \rangle + \langle w, u \rangle}$$

$$= \overline{\langle u, v \rangle + \overline{\langle u, w \rangle}}$$

$$= \overline{\langle u, v \rangle + \langle u, w \rangle}.$$

For homogenity in the second slot, we have

$$\langle u, \lambda v \rangle = \overline{\langle \lambda v, u \rangle}$$

$$= \overline{\lambda \langle v, u \rangle}$$

$$= \lambda \langle v, u \rangle$$

$$= \lambda \overline{\langle u, v \rangle}$$

$$= \lambda \langle u, v \rangle.$$

**Problem Example 6.4(a).** Show that the function  $\langle ., . \rangle : F^n \times F^n \to \mathbb{C}$  define by

$$\langle (w_1,\ldots,w_n),(z_1,\ldots,z_n)\rangle = w_1\overline{z_1}+\cdots+w_n\overline{z_n}$$

is an inner product.

*Proof.* **Positivity.** Let  $(w_1, \ldots, w_n) \in F^n$ . We must show that  $w_1 \overline{w_1} + \cdots + w_n \overline{w_n}$  is real and non-negative. It suffices to show that  $w_k \overline{w_k}$  is real and non-negative for each k. Given  $k \in \{1, \ldots, n\}$ , choose  $a, b \in \mathbb{R}$  such that  $w_k = a + bi$ . We have  $w_k \overline{w_k} = (a + bi)(a - bi) = a^2 + b^2 > 0$ .

**Definiteness.** For the forward direction, assume that  $\langle w, w \rangle = 0$ . We'll show that each  $w_k = a + bi = 0$ . In the positivity proof, we showed that  $w_k \overline{w_k} \geq 0$ . Since  $\langle w, w \rangle = 0$ , each  $w_k \overline{w_k} = 0$ . We have

$$0 = w_k \overline{w_k}$$
$$= a^2 + b^2$$

, so a = 0 and b = 0. The backward direction is straightforward.

Additivity in first slot. Let  $u, v, w \in F^n$ . Then,

$$\langle u+v,w\rangle = (u_1+v_1)\overline{w_n} + \dots + (u_n+v_n)\overline{w_n}$$

$$= (u_1+\overline{w_1}+\dots+u_n+\overline{w_n}) + (v_1+\overline{w_1}+\dots+v_n+\overline{w_n})$$

$$= \langle u,w\rangle + \langle v,w\rangle.$$

Homogeneity in first slot. Let  $\lambda \in F$  and let  $u, v \in F^n$ . Then,

$$\langle \lambda u, v \rangle = \lambda u_1 \overline{v_1} + \dots + \lambda u_n \overline{v_n}$$
$$= \lambda (u_1 \overline{v_1} + \dots + u_n \overline{v_n})$$
$$= \lambda \langle u, v \rangle.$$

Conjugate symmetry. Let  $u, v \in F^n$ . We have

$$\overline{\langle v, u \rangle} = \overline{v_1 \overline{u_1} + \dots + v_n \overline{u_n}}$$

$$= \overline{v_1} u_1 + \dots + \overline{v_n} u_n$$

$$= u_1 \overline{v_1} + \dots + u_n \overline{v_n}$$

$$= \langle u, v \rangle.$$

Problem Theorem 6.10. Let  $v \in V$ .

- (a). ||v|| = 0 if and only if v = 0.
- **(b).**  $\|\lambda v\| = \lambda \|v\|$  for all  $\lambda \in F$ .

*Proof.* Part (a). Follows straightforwardly from the fact that  $\langle v, v \rangle = 0$  if and only if v = 0. Part (b). Let  $\lambda \in F$ . We have

$$\|\lambda v\|^2 = \langle \lambda v, \lambda v \rangle$$
$$= \lambda \overline{\lambda} \langle v, v \rangle$$
$$= |\lambda|^2 \langle v, v \rangle.$$

Taking the square root gives the desired result.
